

ABSTRACT

According to one embodiment of the invention, feeder logic is implemented as a software program stored in a machine readable medium and executed by a processor. The feeder logic is adapted to access indexing data associated with a pre-stored data unit. The pre-stored data unit including content in a scrambled format. The feeder logic is further adapted to generate a trigger data sequence and to insert the trigger data sequence into a data stream processed by a descrambler in response to detection that the content in the scrambled format cannot be descrambled by the descrambler using a currently valid descrambling key. The trigger data sequence is inserted prior to scrambled content of the pre-stored data unit to be processed.
